

One of the main part of the elevator is its electronics. It is essential for both efficiency and durability, that are the basic principles of the new system «MYTA», which together with incredible versatility makes this product one of the top in the international market.

Based on many years of experience we have created a competitive product suitable for different types of installations, widely applicable and therefore economical.

Elasticity of the system allows installation on an old elevator and its preservation on a new in case of reconstruction (with accessories of the new elevator if required), what delivers superior comfort in an old elevator and cost and time of implementation saves of the new one.

In the first phase of assembly it is most often to install a new switchboard with «MYTA» system, and then another small switch with inverter and eventual necessary components is installed together with a new elevator.

For existing elevators we recommend to implement the «MYTA» system with alarm device and floors call buttons and/or cabin panel for the best use of new switchboard and revitalizing the style of elevator and its functionality. These components can be used for new elevator as well.

The switchboard «MYTA» is perfect for new installation of all the elevators types which makes full use of its every function thanks to the possibility of aimed personalization.

The particular attention was paid to the design phase to obtain a product that guarantees fast installation, which together with cables prepared at our workplace ensures almost continuous operation, and so minimize the discomfort of user in case of elevator's shutdown.

For more information contact our staff, we will be glad to prepare the customized solution suitable to your needs.
