

One of the most sensitive elements of the elevator are automatic doors, which embody the interconnection of its fixed and movable parts. Therefore, one of the most common disorders is the loss of interplay between the door and associated safety systems.

Careless handling, wanted or unwanted, is the biggest cause of failures and malfunctioning. Also, the frequent and long-term use has an impact on the efficiency of the door. Area-wide photocell „FTC“ prevents this kind of disorders and protects users, wing doors and the door itself, and extends its life.

Another case when the photocell „FTC“ takes full advantage of its potential is elevator without cabin doors. In this case its primary function is extended for user's safety, It protects user when he is too close to the front wall of the shaft when elevator's cabin is moving.

The high number of control rays, that are close to each other and are crossed, guarantees effective and safe intervention if necessary, and using of the infra-red LEDs provides fast and durable operation in the long term.

Due to several fixing methods and/or different mounting and covering profiles the photocell is very easy to be installed. The installation is very quick and thereby it reduces the discomfort of the user in case of elevator's shutdown.

For more information contact our staff, we will be glad to prepare the customized solution suitable to your needs.
